

Figure 1 illustrates the potential role of mosquito bites in stimulating the immune system of both humans and animals by transmitting “non Pathogenic Viruses” to block the process known as “Species jumps” .

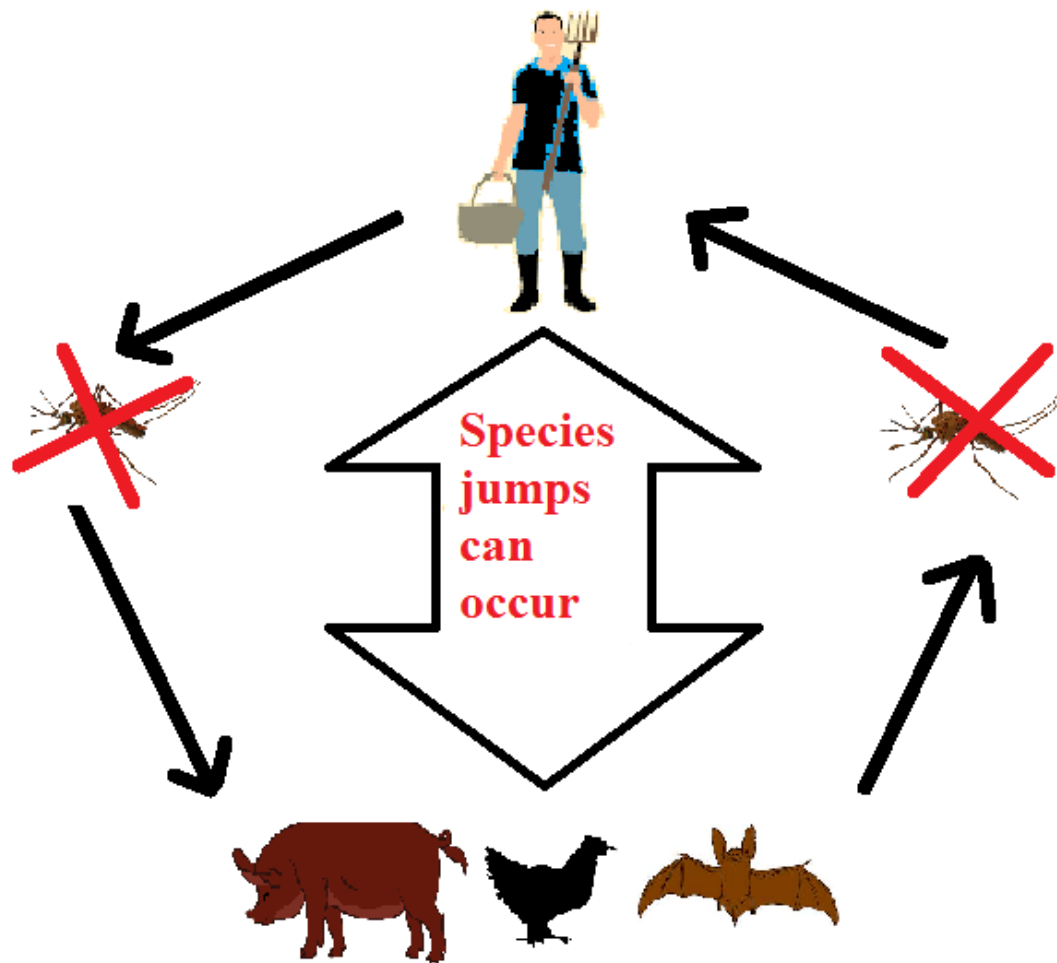

Figure No. 2 shows that in the absence of the potential role of mosquito bites in stimulating the immune system (due to the excessive elimination of mosquitoes) of both humans and animals by transmitting “non Pathogenic Viruses” the process known as “Species jumps” is not blocked resulting in the emergence of new viruses.
